

Your organization have got a one-year project where you will need computations. Throughout the year at least one PC is necessary. In the months of March, August and November the demand becomes 5, 7 and 19 PCs. One PC costs 50,000/= Taka. Instead of buying the PCs, you can also use rented PCs with the cost of Taka 500/= per day per PC. Using a utility pricing model determines what will be beneficial for your organization, buying PCs or using rented computers.

$$P=19, \text{ Total demand} = 365 + 31 \cdot 4 + 6 \cdot 31 + 18 \cdot 30 = 1205, A = 1205 / 365 = 3.33$$

$$B = 50000 / 365 = 137.00$$

$$C = 500.00$$

$$U = C / B = 500 / 137 = 3.65$$

$$P/A = 19 / 3.30 = 5.76$$

$$U < P/A, \text{ So, owning is better here. } CT = U \cdot B \cdot A \cdot T = 3.65 \cdot 137 \cdot 3.30 \cdot 365 = 21644763.26$$

$$BT = P \cdot B \cdot T = 19 \cdot 137 \cdot 365 = 950095$$

Your organization have got a one-year project where you will need computations. Throughout the year at least one PC is necessary. On 26 March, 30 August and 04 November the demand becomes 5, 7 and 19 PCs. One PC costs 50,000/= Taka. Instead of buying the PCs, you can also use rented PCs with the cost of Taka 500/= per day per PC. What will be beneficial for your organization, buying PCs or using rented computers.

$$P=19, \text{ Total demand} = 365 + 4 + 6 + 18 = 393, A = 393 / 365 = 1.08$$

$$B = 50000 / 365 = 137.00$$

$$C = 500.00$$

$$U = 500 / 137 = 3.65$$

$$P/A = 19 / 1.08 = 17.59$$

$$U < P/A, \text{ So, Cloud is better here. } CT = U \cdot B \cdot A \cdot T = 3.65 \cdot 137 \cdot 1.08 \cdot 365 = 197119.71$$

$$BT = P \cdot B \cdot T = 19 \cdot 137 \cdot 365 = 950095$$
