

Lab Work

1. Using the Azure Portal, create a Linux Virtual Machine. Configure an appropriate resource group, region, VM size, username, and authentication method. After deployment, show the VM overview and identify its Public IP, Private IP, VM size, and status. **3*5**
2. Create an Azure Storage Account and a Blob Container. Upload a sample file to the container and demonstrate how the stored file can be accessed. Briefly identify the purpose of the Storage Account and Blob Container.
3. Create an Azure App Service Web App and deploy a simple webpage containing your Student ID, Name, and a “Welcome to Cloud Computing Lab” message. Run the application using the generated URL and show the deployed output.
4. Viva **3**
